Thanks for your confidence choosing our product.

These operating instructions present themselves as an overview of the technical data and features.

Please read the operating instructions before operating the product.

If you have any questions, please contact your nearest SSD Drives representative. Improper application of the product in combination with dangerous voltage can lead to injuries.

In addition, damage can also occur to motors or other products. Therefore please observe our safety precautions strictly.

### **Safety precautions**

We assume that, as an expert, you are familiar with the relevant safety regulations, especially in accordance with VDE 0100, VDE 0113, VDE 0160, EN 50178, the accident prevention regulations of the employers liability insurance company and the DIN regulations and that you are able to use and apply them.

As well, relevant European Directives must be observed.

Depending on the kind of application, additional regulations e.g. UL, DIN are subject to be observed.

If our products are operated in connection with components from other manufacturers, their operating instructions are also subject to be observed strictly.

## 1 630 Introduction to CAN

### 1.1 Target group

This documentation describes the functionality of 630 series drives inside a CAN network.

You should be familiar with the basic functions of the 630 drives and with the setup and diagnosis software EASYRIDER®.

The hard- and software you use with the 630 series CAN interface must comply with the guidelines by the CiA.

### 1.2 Basic properties of the CAN-bus

In contrast to other fieldbus systems, CAN-bus does not operate in a station-based way but uses a (**object oriented**) content-addressing.

This means that the useful data is seen as objects to which names are assigned. Priorities (**identifiers**) for bus access are given to these message objects in the target system under which they can then be requested or sent, respectively.

This feature offers the advantage that the bus is used exclusively by stations with which a transmission request is queued. Thus the bus is not burdened unnecessarily as, for example, with the polling process.

A further advantage with CAN is the **Multi-Master Capability**. This means that each user on the bus has the same access rights. The access authorization alone controls the users among one another via the priority of the communication objects and their **identifiers** (arbitration). This allows direct communication between the individual users without a time-consuming "detour" over a central master.

A CAN telegram may contain up to **8 byte of user data**.

#### 1.2.1 Transmission

The maximum bus length is depending on the chosen baud rate:

<b>20kBit/s</b>	approx. <b>800 m</b>
<b>50kBit/s</b>	approx. <b>600 m</b>
<b>125kBit/s</b>	approx. <b>500 m</b>
<b>250kBit/s</b>	approx. <b>250 m</b>
<b>500kBit/s</b>	approx. <b>100 m</b>
<b>800kBit/s</b>	approx. <b>50 m</b>
<b>1MBit/s</b>	max. <b>25 m</b>

The 630 series drives support all the baud rates listed above.

The user organisation **CiA** (**CAN in automation**) has declared the bus medium according to ISO/DIS 11898 as their standard. This standard is also supported by the 635/637.

A **shielded twisted pair cable** is to be used as the bus cable. (for pin assignment see chapter 3)

### 1.3 Attaching the 630 series drives to the CAN-bus

Before using the drive on the CAN-bus you should consider the following questions:

- A. How many devices(nodes) will be connected to the bus? (also count additional nodes for future extensions)
- B. What is the maximum cable length?
- C. Which configuration is needed?

The answers to these questions determine the parameters for baud rate, identifier assignment and configuration mode.

#### Physical medium

The CAN interface is galvanically isolated. A CAN-transceiver on the 635/637 can be used for coupling onto the bus in accordance with **ISO/DIS 11898**.

#### Bus termination

A defined quiescence level on the bus must be guaranteed for communication. It is necessary to use terminal resistors on both ends of the line.

This must be done with special bus plugs with which there is a resistance of approx.  $124\Omega$  between CAN\_L and CAN\_H.

With a 637f and either one of the options RP-2C8 or RP-2Ca you can enable a bus termination resistor by activating the DIL-switch 1 for bus-termination.

#### 637f with option RP-2C8 or RP-2CA

bus-termination active for COM 2

## 1.3.1 Pin assignment for COM2 - 635/637/637+/637f drive

Pin	Description	Name
1	-	-
2	CAN_L wire (dominant low)	CAN_L
3	Ground	GND
4	-	-
5	-	-
6	Ground	GND
7	CAN_H wire (dominant high)	CAN_H
8	-	-
9	-	-

## 1.3.2 Pin assignment for X20/21 CAN – 631 drive

Pin	Function	X20	X21
	X20 and X21 are identically and internal switched in parallel with all pins. (X20 = X21)  Therefore bus-wiring is easy.	8-pole Modular Jack, screened 	8-pole Modular Jack, screened 
-	internal conn. to GND via capacitor	Case: Shielding	Case: Shielding
1			
2			
3	CAN_GND reference galvanically separated. Coupling-resistor to PE / GND: 1MΩ		
4	CAN_L (dominant low)		
5	CAN_H (dominant high)		
6			
7	(CAN_GND, like Pin 3)		
8			

This Pin-Assignment is related to „CiA Draft Recommendation DR-303, V0.1 / 16.10.98“. The wires on Pins 3/6 and 4/5 should be twisted pairs.

## 1.4 Configuration modes

Since the CAN-bus functionality of the 630 series drives is constantly advancing different configuration modes had to be realized over the time.

Configuration mode	Properties
<b>0: PC configuration</b>	Addressing is defined through manual input with EASYRIDER. The communication relationships and data contents is statically predefined.
<b>1: PC configuration with node numbers offset</b>	Addressing and node numbers are defined through manual input with EASYRIDER. Data contents is statically predefined.
<b>2: PC configuration + Wait for IBT-communication</b>	Addressing is defined through manual input with EASYRIDER. Data contents is statically predefined. In addition the drive waits for data transfer with the IBT before starting automatic operation mode.
<b>3: CANopen configuration DS301</b>	Addressing is done conforming to the CANopen standard DS301, data contents for PDO1 and PDO2 are statically predefined.
<b><a href="#">4: CANopen configuration DS402</a></b>	Addressing and control is done conforming to the CANopen standard DS402 Motion Profil incl. PDO-mapping functions.
<b><a href="#">5: CANopen configuration DS301+ PDO mapping</a></b>	Addressing is done conforming to the CANopen standard DS402 Motion Profil incl. PDO-mapping functions. The control of the DS402 State-machine is being ignored. 6040h,6041h control- and statusword are not being evaluated.

## 1.5 Configuration

### *Short list of instructions for initializing the 635/637 for CAN bus connection*

Initializing the CAN bus connection on the 635/637 can be done with the EASYRIDER software.

- Configuration is done by opening → **Commissioning** → **Fieldbus**

Here you can adjust the appropriate parameters.  
You must specify the following configuration data:

- **Configuration mode**
  - **IDENTIFIER or node number ( or DIL Switch)**
  - **baud rate (or DIL-Switch)**
  - **reaction on bus-interruption**
- By pressing the Enter key, the initialization data is send to the 630 drive.
  - The data has to be saved into the EEPROM bei pressing F7.

Connect the 630 drive with the bus cable.

Open the fieldbus diagnosis in EASYRIDER by chosing „Diagnosis/Fieldbusdiagnosis“ from the menu and check for working communication.

## 2 CANopen Introduction

### 2.1 Definitions and abbreviations

<b>CAN</b>	<b>Controller Area Network</b>	
CAL	CAN Application Layer	
CMS	CAN Message	A service element in the application layer.
COB	Communication Object	Transport unit within the CAN network. Data must be transmitted through the CAN network in a COB.
COB-ID	COB-Identifier	Definite allocation of the COB. The identifier defines the priority of the COB within the bus communication.
DBT	Distributer	The DBT supports dynamic assignment of identifiers between one module (DBT master) and another one (DBT slaves).
LMT	Layer Management	A service element in the application layer (CAN reference model). Is necessary to configure parameters in the single layers.
NMT	Network Management	A service element in the application layer (CAN reference model). NMT performs the initialization, configuration and error management within the bus communication.
SDO	Service Data Object	A data element with low priority. Is necessary for configuration of the bus node.
PDO	Process Data Object	A data element with high priority. Is necessary for real-time data transfer.
RTR	Remote Transmission Request	Data request telegram ( without data content)

Further the following shortcuts are used in this manual:

FC	Function code	Determines the kind of message which is trasmitted via bus.
KN	Node number	Definite allocation of the bus node.
LSB	Last Significant Bit/ Byte	Least significant bit/byte
MSB	Most Significant Bit/ Byte	Most significant bit/byte
ro	read only	Utility, resp. parameter can only be read.
rw	read/write	Utility, resp. parameter can be read as well as written.
wo	write only	Utility, resp. parameter can only be written.

**Number representation:** If not specified otherwise decimals are indicated as digits without suffix (e.g. 1234). Hexadecimal values are identified with a h behind the digits( e.g. 0123h).

## 2.2 General information to CANopen

CANopen is a standard, acquired by the association CiA „CAN in Automation“.

The concept of the CAN communication can be described with the ISO-OSI reference model for interfaces.

The specifications of the definitions and functions of CANopen communication according to this reference model are documented by the CiA in the following manuals:

<b>CiA Draft Standard 201-207</b>	CAL; CAN Application Layer for Industrial Application	This documentation specifies the general management of the network and the transmission of objects.
<b>CiA Draft Standard 301</b>	CANopen; CAL-based Communication Profile for Industrial Systems	This documentation concretizes the definitions according to Draft 201-207 and specifies the structure of the object directory and the access to CANopen devices.
<b>CiA Draft Standard 402</b>	CANopen Devices Profile; Drives and Motion Control	This documentation includes all definitions for drive controllers in a CANopen network.

The supported functions for controllers of 630 series, by these standards according to CAL and CANopen, are described in this manual.

## 2.3 General structure of data transfer

The data transfer in CAN is made via message telegrams. Basically the telegrams can be divided schematically in COB-ID and 8 following bytes:

COB-ID	8 bytes of user data							
11 Bit	Byte 0	Byte 1	Byte 2	Byte 3	Byte 4	Byte 5	Byte 6	Byte 7

## 2.4 The COB-ID

The COB-ID (communication object identifier) is the message address of a data packet in a CANopen network.

The valence of the message address determines the priority of the message at concurrent transmission of several stations. The message address with value 0 has highest priority.

The 11 bit of the COB-Identifier are composed as follows:

10	9	8	7	6	5	4	3	2	1	0
function code				node number						

The COB-Identifier comprises the definite allocation of the message object. It is composed of the function code, which takes the different kinds of messages into account; and the node number, which is definite allocated to each device.

The node number will be set via EASYRIDER for Windows software.

The node number is composed of seven bits (1- 127).

## 2.5 The function codes

The following function codes are available:

(rx) and (tx) are relates to the slave (drive)!

Object	Function code (binary)	Result. COB-ID	hexadecimal	Communication parameter Fixing at index
NMT	0000	0	0h	
SYNC	0001	128	80h	(1005h)
Emergency	0001	129-255	81h-FFh	(1014h)
PDO1 (tx)	0011	385-511	181h-1FFh	1800h, 1A00h
PDO1 (rx)	0100	513-639	201h-27Fh	1400h, 1600h
PDO2 (tx)	0101	641-767	281h-2FFh	1801h, 1A01h
PDO2 (rx)	0110	769-895	301h-37Fh	1401h, 1601h
PDO3 (tx)	0111	897-1023	381h-3FFh	1802h, 1A02h
PDO3 (rx)	1000	1025-1151	401h-47Fh	1402h, 1602h
PDO4 (tx)	1001	1153-1279	481h-4FFh	1803h, 1A03h
PDO4 (rx)	1010	1281-1407	501h-57Fh	1403h, 1603h
SDO (tx)	1011	1049-1535	581h-5FFh	
SDO (rx)	1011	1537-1663	601h-67Fh	
Node guarding	1110	1793-1919	701h-77Fh	(100Eh)

Which objects are used and supported by a device, is fixed in the object library of the device.

This object library for each device is stored in the EDS file (electronical data sheet).

All EDS files for the SSD Drives devices are stored on the installation CD of the EASYRIDER for Windows software or on the website [www.SSDDrives.de](http://www.SSDDrives.de).

### 3 630 CANopen SDO message

SDO accesses are always triggered by the master control. At this it can be a matter of both a read request and a write request, which must be acknowledged by the controller.

With the SDO services access (write and read of parameters) to the object library of the controller is possible.

SDO telegrams are structured as follows:

COB-ID	Command	Index		Subindex	Service data			
11Bit	Byte 0	Byte 1	Byte 2	Byte 3	Byte 4	Byte 5	Byte 6	Byte 7
		LSB	MSB		LSB			MSB

**Note: SDO telegrams always have a telegram length of 8 byte.**

**Not used data bytes will be transmitted with 0!**

#### The command byte

The command byte includes the request mode of the message telegram.

At this it's distinguished between a set-parameter-telegram (domain download), a request-telegram (domain upload) and alarm messages (warnings).

Via the set-parameter-telegram parameterization data will be transmitted to the controller.

Via the request-telegram the stored parameterization data can be returned (read back) into the master.

Alarm messages will be returned from the controller to the master, if a transmitted telegram can not be executed.

Command	Function	Telegram mode		Action
22h, 23h, 2Bh, 2Fh (*)	domain download	Request master	→ drive	send parameter to drive
60	domain download	Confirmation drive	→ master	parameter adopted
40h	domain upload	Request master	→ drive	read parameter
43h, 4Bh, 4Fh (*)	domain upload expedited	Response drive	→ master	send parameter to master
61h	domain upload normal	Response drive	→ master	parameter length to master
60h (70h)	domain upload segment	Request master	→ drive	read segment parameter
80h	warning	Response drive	→ master	transmission error

(\*) The value of the command byte determines the data length of the read parameter!

Command	Data length	Data type
22h, 23h, 43h	4 Byte	Unsigned 32
2B, 4Bh	2 Byte	Unsigned 16
2F, 4F	1 Byte	Unsigned 8

## 4 Object library

In the object library all parameters and services available, as well as their characteristics, are fixed.

Index	Name	Object code	Data type	Access	PDO mapping

Objects marked by a \* are connected to a factor from the factorgroup (here: factor=1).

## 5 CANopen “Error messages with SDO services”

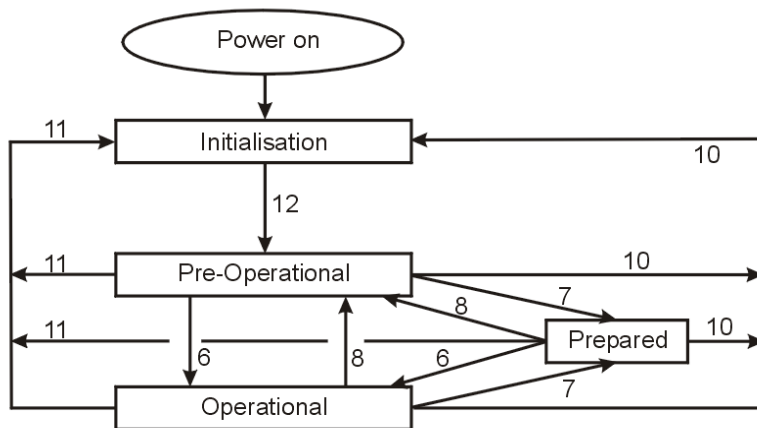

Error code	Description
0601 0000h	Access to the object is not supported ( <a href="#">see example</a> )
0602 0000h	Object does not exist in the object list
0604 0041h	Object can not be mapped into the PDO
0604 0042h	Number and length of the mapped objects exceed PDO length
0607 0010h	Message type or message length do not fit the data length of the object
0609 0011h	Sub index does not exist
0609 0030h	Parameter has an invalid value ( <a href="#">see example</a> )
0609 0031h	Parameter's value is too high
0609 0032h	Parameter's value is too low
0800 0022h	Data can not be written into the device due to the actual device state (operating mode wrong, PDO not activated or invalid entries)

## 6 630 Network management according to CANopen DS 301

Precondition for integration of the controller into a CANopen network is a network master, which coordinates the network services (e.g. higher level loop PLC, IPC or host computer).

**This master takes over then the NMT (Network Management) services**, which enable the configuration, initialization and the error management in a CAN network.

The service element "network management" (NMT) forms the basic premise for operating a CAN network. The task of the NMT is simplified shown by the following state transition diagram.

Explanation of the state diagram:

- (6) Start\_Remote\_Node
- (7) Stop\_Remote\_Node
- (8) Enter\_Pre\_Operational
- (10) Reset\_Node
- (11) Reset\_Communication
- (12) Initialisation finished- enter Pre-Operational automatically

After power on the controller the CAN interface and the CAN services will be initialized corresponding to the Baud rate and the set node number.

The controller switches then automatically to operating state „Pre-operational“.

In operating state „Pre-operational“ only the SDO services are active!

For performing process data communication (PDO), the controller is to switch to operating state „Operational“ by the net work master (with NMT service „Start remote node“).

### Code example:

Master	Cob-ID	Byte 0	Byte 1	Regler	
→	NMT message	0h	Node ID	→	
		cs	Node ID		
		Value description: command specifier	Value description: Node ID		
		xxh	xxh		
		cs = 1 START Node	Node ID = 0 addresses all slaves		
		cs = 2 STOP Node	Node ID = 1 - 127 addresses specific slave		
		cs = 128 Enter Pre-Operatrional			
		cs = 129 Reset Node			
		cs = 130 Reset Communication			

The respective bus state of the controller is displayed in the EASYRIDER Field bus diagnosis.

### 7 630 CANopen PDO messages

Process data objects (PDOs) are data packets, which can be transmitted event-controlled in the CAN bus. In contrast to a SDO, for transmission of a PDO there is no handshake provided between sender and receiver.

All devices of the controller series 630 support 4 receive PDOs (PDO1rx – PDO4rx) and 4 transmit PDOs (PDO1tx – PDO4tx).

The fixing of functionality and of data contents of the PDO messages will be set in the object library by the SDO telegrams.

(see following table)

The default settings for the PDOs will be generated with the SDO service 1011h „Restore parameter“ and the SDO service 1010h „Save parameter“.

Modifications of the PDO definitions are permitted in operating state **Pre-operational** only. By writing the parameter „number\_of\_mapped\_objects“ the validity of data will be checked and the function activated. Maximum 8 objects can be defined in a PDO telegram with a maximum length of 8 byte (64 bit). With the SDO service 1010h „Save parameter“ the last set mapping entries can be stored in the controller power fail-safe.

Activation of the PDOs happens by the NMT command „NMT start node“ at transition to state „**Operational**“.

The controller is configured with the following PDO initial setting:

## Receive PDO messages

### 1. Receive PDO

Index	Subindex	Comment	Default value
1400h	0	number of entries	2
	1	COB-ID used by PDO	200h + Node ID + enable
	2	transmission type	255

1600h	0	number of mapped objects	1
	1	controlword	60400010h
	2-8	optional	0

### 2. Receive PDO

Index	Subindex	Comment	Default value
1401h	0	number of entries	3
	1	COB-ID used by PDO	300h + Node ID + enable
	2	transmission type	255

1601h	0	number of mapped objects	2
	1	controlword	60400010h
	2	modes_of_operation	60600008h
	3-8	optional	0

### 3. Receive PDO

Index	Subindex	Comment	Default value
1402h	0	number of entries	3
	1	COB-ID used by PDO	400h + Node ID + disable
	2	transmission type	255

1602h	0	number of mapped objects	2
	1	controlword	60400010h
	2	traget_position	607A0020h
	3-8		0

### 4. Receive PDO

Index	Subindex	Comment	Default value
1403h	0	number of entries	3
	1	COB-ID used by PDO	500h + Node ID + disable
	2	transmission type	255

1603h	0	number of mapped objects	2
	1	controllword	60400010h
	2	profile velocity	60810020h
	3-8	optional	0

## Transmit PDO messages

### 1. Transmit PDO

Index	Subindex	Comment	Default value
1800h	0	number of entries	5
	1	COB-ID used by PDO	180h + Node ID + enable
	2	transmission type	255
	3	inhibit timer	0
	4	reserved	0
	5	event timer	0

1A00h	0	number of mapped objects	1
	1	statusword	60410010h
	2-8	optional	0

### 2. Transmit PDO

Index	Subindex	Comment	Default value
1801h	0	number of entries	3
	1	COB-ID used by PDO	280h + Node ID + enable
	2	transmission type	255
	3	inhibit timer	0
	4	reserved	0
	5	event timer	0

1A01h	0	number of mapped objects	2
	1	statusword	60410010h
	2	modes_of_operation_dispay	60610008h
	3-8	optional	0

### 3. Transmit PDO

Index	Subindex	Comment	Default value
1802h	0	number of entries	5
	1	COB-ID used by PDO	380h + Node ID + disable
	2	transmission type	255
	3	inhibit timer	0
	4	reserved	0
	5	event timer	0

1A02h	0	number of mapped objects	2
	1	statusword	60410010h
	2	position_actual_value	60640020h
	3-8		0

### 4. Transmit PDO

Index	Subindex	Comment	Default value
1803h	0	number of entries	3
	1	COB-ID used by PDO	480h + Node ID + disable
	2	transmission type	255
	3	inhibit timer	0
	4	reserved	0
	5	event timer	0

1A03h	0	number of mapped objects	2
	1	statusword	60410010h
	2	velocity actual value	606C0020h
	3-8	optional	0

### Permissible mapping objects of the controller

Receive PDO mapping objects momentary supported by the controller:

controlword	6040h	0010h	target_velocity	60FFh	0020h
modes_of_operation	6060h	0008h	vl_target_velocity	6042h	0010h
target_position	607Ah	0020h	home_offset	407C	0020h
profile_velocity	6081h	0020h	istpos_2	4200h	0020h
interpolation_data_record	60C1h	0120h	istpos_3	4201h	0020h
			Variable 0 - 255	4100h-41FFh	0020h

Transmit PDO mapping objects momentary supported by the controller:

Statusword	6041h	0010h	digital inputs	60FDh	0020h
modes of operation display	6061h	0008h	digital inputs (low word)	60FDh	0010h
position demand value	6042h	0020h	digital inputs (high word)	60FDh	0008h
position actual value (incr.)	6063h	0020h	istpos_2	4200h	0020h
position actual value	6064h	0020h	istpos_3	4201h	0020h
vl velocity demand	6043h	0010h	Variable 0 - 255	4100h-41FFh	0020h
vl velocity effort	6044h	0010h			
velocity actual value	606Ch	0020h			

## 8 630 CANopen Node Guarding

Under employment of the node guard function the bus master can read out the state of the controller with a Remote Transmit Request on the node guarding identifier.

The node monitoring should always be used where the drive is transmitting data via the bus just in irregular intervals (event-controlled). If the controller with other services is in continuous communication with the master, this additional function is not necessary.

After power on the drive the first toggle bit will be always transmitted with 0. By means of the bits 0 - 6 the actual status of the NMT State Machine will always be co-transmitted.

The parameter guard time (Object Index 100Ch) and life time factor (Object Index 100Dh) are not being evaluated by the controller and are always 0 after power on.

### Code example:

## 9 EMCY Errorcode

### Emergency Object State Diagram

A device may be in one of two emergency states (see figure).

Depending on the transition(1-4) the corresponding emergency telegram is sent.

**0.** After the initialisation of the drive it enters the „error free“ state if no error has been detected. The message “no error” is being sent.

**1.** The drive detects an internal error and sets the appropriate error code and the error register in the first three bytes of the emergency telegram. The drive’s state is changing to “error occurred”. An emergency object with the corresponding error code and error register is being sent. The error code is also entered into the array of object 1003h (pre-defined error field).

**2.** One error – but not all errors – is cleared. An emergency telegram with error code 0000 (error reset), the still pending errors in their error register and the manufacturer specific error field is being sent.

**3.** A new – additional – error occurs to the drive. It stays in the “error occurred” state and sends an emergency object with the corresponding error code. The new error code is inserted as first entry

of the array of error codes (1003h). The error codes are sorted by the time of appearance – older errors have higher subindices.(refer to object 1003h; max. 8 entries)

**4.** All errors are cleared. The device changes to the „error free“ state and sends an emergency telegram with the error code „reset error / no error“.

**Table 1: Emergency Error Codes 630 drives**

Meaning Error group	Error Code (hex)	630 Error register nr. (Obj 1001h)	manuf. specific error field	630 display symbol	supporte d in drive
Error Reset or No Error  00xx no error	0000h	00h	„Vxxxx“ (ASCII)  xxxx = Firmwareversion i.e. 819d		637f, 631, 635, 637

## 10 CANopen „Device control according to CANopen DS402 ”

The device control for drive controllers according to CANopen DS 402 standard is described in the State Machine. The State Machine fixes the possible control signals to the controller, the state of the controller and the permissible state changes.

Via the object [“controlword” \(6040h\)](#) the State Machine is being controlled. The actual state of the State Machine can be read out via the object [Objekt “statusword” \(6041h\)](#).

Further effects on the State Machine have the internal error messages, the enable input, local ↔ remote commands of the serial interface and the set operation mode.

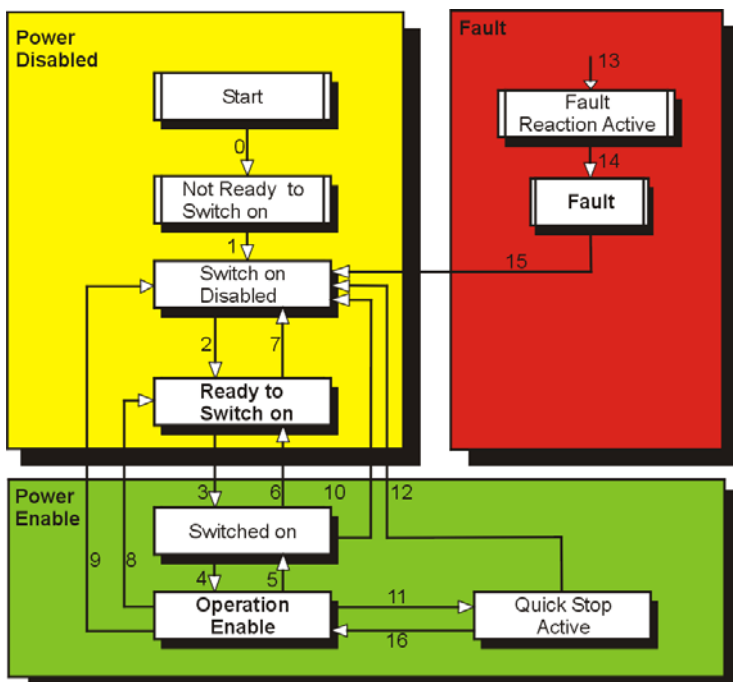

([Object: 6060h modes of operation](#))

**Note:**

After power on the controller is always positioned in operation mode 1 = Profile Position Mode

### 10.1 CANopen „State Machine ”

## 10.2 CANopen „States and transitions of the state machine“

State	Meaning	State transitions		<b>cw = controlword</b> <b>sw = statusword</b> bit 15.....bit0
(Start) <b>Not Ready to Switch On</b>	After power on the controller runs its power-up procedure, the power fail-safe values will be loaded as actual values.			cw 0000 0000 0000 0000  sw 0000 0000 0000 0000
		1	The power-up procedure is completed and the CAN communication will be activated.	
		7 9 10 12 15	Disable Voltage or Quick Stop received from  <b>Ready to Switch on or Switch on</b> Disable Voltage from <b>Enable operation</b> . Disable Voltage or Quick Stop completed received from <b>Quick Stop</b> . Fault Reset (edge) received from <b>Fault</b>	cw xxxx xxxx xxxx x00x  cw xxxx xxxx xxxx xx0x  cw xxxx xxxx 1xxx xxxx
<b>Switch on Disable</b>	Controller checks switch-on conditions: a. Controller Active Input = 24 V b. Controller is not deactivated by the serial interface. If the conditions are fulfilled, the remote bit in the statusword will be set and the Shutdown command is being expected.		Bit 9 in statusword „Remote“ must be on !	sw xxxx xx0x x1xx 0000 ↓ sw xxxx xx1x x1xx 0000
		2 6 8	Shut down command received from <b>Switched On</b> from <b>Operation Enable</b>	cw xxxx xxxx xxxx x110  cw xxxx xxxx 1xxx x110
<b>Ready to Switch on</b>	The controller is deactive and is waiting for the Switch On command.			sw xxxx xx1x x01x 0001
		3	Switch on Kommando received	cw xxxx xxxx xxxx x111
<b>Switch On</b>	The controller is deactive and is waiting for the Enable Operation command.			sw xxxx xx1x x01x 0011

## 14.1 Read unsupported index 1234h

Cob-ID	Command	Index		Sub_ID	Data			
		Byte 1 (LSB)	Byte 2 (MSB)		Byte 4 (LSB)	Byte 5	Byte 6	Byte 7 (MSB)
Bit 0...10	Byte 0	Byte 1 (LSB)	Byte 2 (MSB)	Byte 3	Byte 4 (LSB)	Byte 5	Byte 6	Byte 7 (MSB)

<b>Master</b>	Read unsupported index 1234h								<b>Drive</b>
→	601h	40h	34h	12h	00h	00h	00h	00h	→
←	581h	80h	34h	12h	00h	00h	01h	06h	←

Abort and reply with the [error code 0601 0000h](#):  
Access to this object is not supported.

## 14.2 Write an unsupported parameter

Cob-ID	Command	Index		Sub_ID	Data			
		Byte 1 (LSB)	Byte 2 (MSB)		Byte 4 (LSB)	Byte 5	Byte 6	Byte 7 (MSB)
Bit 0...10	Byte 0	Byte 1 (LSB)	Byte 2 (MSB)	Byte 3	Byte 4 (LSB)	Byte 5	Byte 6	Byte 7 (MSB)

<b>Master</b>	Write an unsupported parameter								<b>Drive</b>
→	601h	2Fh	60h	60h	00h	09h	00h	00h	→
←	581h	80h	60h	60h	00h	30h	00h	09h	06h

Abort and reply with the [error code 0609 0030h](#):  
Parameter has an invalid value.

## 14.3 Check device type (read object: 1000h)

Cob-ID	Command	Index		Sub_ID	Data			
		Byte 1 (LSB)	Byte 2 (MSB)		Byte 4 (LSB)	Byte 5	Byte 6	Byte 7 (MSB)
Bit 0...10	Byte 0	Byte 1 (LSB)	Byte 2 (MSB)	Byte 3	Byte 4 (LSB)	Byte 5	Byte 6	Byte 7 (MSB)

<b>Master</b>	Check device type (read object 1000h)								<b>Drive</b>
→	601h	40h	00h	10h	00h	00h	00h	00h	→
←	581h	43h	00h	10h	00h	92h	01h	02h	00h

Acknowledge and reply with the device type

## 14.4 Check error register (read object: 1018h)

Cob-ID	Command	Index		Sub_ID	Data			
		Byte 1 (LSB)	Byte 2 (MSB)		Byte 4 (LSB)	Byte 5	Byte 6	Byte 7 (MSB)
Bit 0...10	Byte 0	Byte 1 (LSB)	Byte 2 (MSB)	Byte 3	Byte 4 (LSB)	Byte 5	Byte 6	Byte 7 (MSB)

<b>Master</b>	Check error register (read object 1018h)								<b>Drive</b>
→	601h	40h	18h	10h	00h	00h	00h	00h	→
←	581h	4Fh	18h	10h	00h	00h	00h	00h	←

Acknowledge and reply with the error register: The drive is error free.

### 14.5 Check device status register (read object: 1002h)

Cob-ID	Command	Index		Sub_ID	Data			
		Byte 1 (LSB)	Byte 2 (MSB)		Byte 4 (LSB)	Byte 5	Byte 6	Byte 7 (MSB)
Bit 0...10	Byte 0	Byte 1 (LSB)	Byte 2 (MSB)	Byte 3	Byte 4 (LSB)	Byte 5	Byte 6	Byte 7 (MSB)

<b>Master</b>	Check device status register (read object 1002h)								<b>Drive</b>
→	601h	40h	02h	10h	00h	00h	00h	00h	→
←	581h	43h	02h	10h	00h	00h	00h	00h	←
	Acknowledge and reply with device status error register The Drive is active and error free.								

### 14.6 Read Node-ID (read object: 100Bh)

Cob-ID	Command	Index		Sub_ID	Data			
		Byte 1 (LSB)	Byte 2 (MSB)		Byte 4 (LSB)	Byte 5	Byte 6	Byte 7 (MSB)
Bit 0...10	Byte 0	Byte 1 (LSB)	Byte 2 (MSB)	Byte 3	Byte 4 (LSB)	Byte 5	Byte 6	Byte 7 (MSB)

<b>Master</b>	Read node ID (read object 100Bh)								<b>Drive</b>
→	601h	40h	0Bh	10h	00h	00h	00h	00h	→
←	581h	43h	0Bh	10h	00h	04h	00h	00h	←
	Acknowledge and reply with the node-ID: The drive has node-ID 4								

### 14.7 Initiate segmented upload of manufacturer device name (read object: 1008h) für 631

Cob-ID	Command	Index		Sub_ID	Data			
		Byte 1 (LSB)	Byte 2 (MSB)		Byte 4 (LSB)	Byte 5	Byte 6	Byte 7 (MSB)
Bit 0...10	Byte 0	Byte 1 (LSB)	Byte 2 (MSB)	Byte 3	Byte 4 (LSB)	Byte 5	Byte 6	Byte 7 (MSB)

<b>Master</b>	Initiate segmented upload of manufacturer device name (read object: 1008h)								<b>Drive</b>
→	601h	40h	08h	10h	00h	00h	00h	00h	→
←	581h	41h	08h	10h	00h	07h	00h	00h	←
	Acknowledge and reply with the length (7 Bytes):								
	Initiate upload of 7 Bytes of the manufacturer device name								
→	601h	60h	08h	10h	00h	00h	00h	00h	→
←	581h	01h	36h	33h	31h	5Fh	34h	30h	32h
			'6'	'3'	'1'	'_'	'4'	'0'	'2'
	Acknowledge and reply with the recognized data block 1"631_402"								

## 14.8 Initialisation of the state machine

Settings : The drive has the node number 1.  
 The value for the baud rate and all drive parameters are stored in the drive.  
 The Drive Active Input X10.7 is connected with 24 V DC.

Actions : Power on the drive and send the following commands:

Cob-ID	Command	Index		Sub_ID	Data			
		Byte 1 (LSB)	Byte 2 (MSB)		Byte 3	Byte 4 (LSB)	Byte 5	Byte 6
Bit 0...10	Byte 0			Byte 3	Byte 4 (LSB)	Byte 5	Byte 6	Byte 7 (MSB)

Master	Drive								
1 <sup>st</sup> step: Request <b>Statusword</b> from drive (read object 6041h)									
→	→								
	<table border="1"> <tr> <td>601h</td> <td>40h</td> <td>41h</td> <td>60h</td> <td>00h</td> <td>00h</td> <td>00h</td> <td>00h</td> </tr> </table>	601h	40h	41h	60h	00h	00h	00h	00h
601h	40h	41h	60h	00h	00h	00h	00h		
←	←								
	<table border="1"> <tr> <td>581h</td> <td>4Bh</td> <td>41h</td> <td>60h</td> <td>00h</td> <td>40h</td> <td>02h</td> <td>00h</td> </tr> </table> <p>Confirmation and return of the Statusword from the controller 0250h          (Remote bit = 1, Switch on disabled)</p>	581h	4Bh	41h	60h	00h	40h	02h	00h
581h	4Bh	41h	60h	00h	40h	02h	00h		
2 <sup>nd</sup> step: Send <b>Shut down</b> controlword to the drive (write object 6040h)									
→	→								
	<table border="1"> <tr> <td>601h</td> <td>2Bh</td> <td>40h</td> <td>60h</td> <td>00h</td> <td>06h</td> <td>00h</td> <td>00h</td> </tr> </table>	601h	2Bh	40h	60h	00h	06h	00h	00h
601h	2Bh	40h	60h	00h	06h	00h	00h		
←	←								
	<table border="1"> <tr> <td>581h</td> <td>60h</td> <td>40h</td> <td>60h</td> <td>00h</td> <td>00h</td> <td>00h</td> <td>00h</td> </tr> </table> <p>Confirmation of takeover from drive to master          (Repeat step 1 → if successful: Statusword from drive: 0231h)</p>	581h	60h	40h	60h	00h	00h	00h	00h
581h	60h	40h	60h	00h	00h	00h	00h		
3 <sup>rd</sup> step: Send <b>Switch on</b> controlword to the drive (write object 6040h)									
→	→								
	<table border="1"> <tr> <td>601h</td> <td>2Bh</td> <td>40h</td> <td>60h</td> <td>00h</td> <td>07h</td> <td>00h</td> <td>00h</td> </tr> </table>	601h	2Bh	40h	60h	00h	07h	00h	00h
601h	2Bh	40h	60h	00h	07h	00h	00h		
←	←								
	<table border="1"> <tr> <td>581h</td> <td>60h</td> <td>40h</td> <td>60h</td> <td>00h</td> <td>00h</td> <td>00h</td> <td>00h</td> </tr> </table> <p>Confirmation of takeover from drive to master          (Repeat step 1 → if successful: Statusword from drive: 0233h)</p>	581h	60h	40h	60h	00h	00h	00h	00h
581h	60h	40h	60h	00h	00h	00h	00h		
4 <sup>th</sup> step: Send <b>Operation Enable</b> controlword to the drive (write object 6040h)									
→	→								
	<table border="1"> <tr> <td>601h</td> <td>2Bh</td> <td>40h</td> <td>60h</td> <td>00h</td> <td>0Fh</td> <td>00h</td> <td>00h</td> </tr> </table>	601h	2Bh	40h	60h	00h	0Fh	00h	00h

581h	60h	40h	60h	00h	00h	00h	00h		

## 14.9 Positionieren über SDO

Settings : The drive is to be move on by 100.000 increments from the actual position with a speed of 1000 min<sup>-1</sup> and after attaining the position return by 100.000 increments with a speed of 100 min<sup>-1</sup>. Steps 1-4 have been successfully executed.

Cob-ID Bit 0...10	Command Byte 0	Index		Sub_ID Byte 3	Data			
		Byte 1 (LSB)	Byte 2 (MSB)		Byte 4 (LSB)	Byte 5	Byte 6	Byte 7 (MSB)

Master									Drive	
	5 <sup>th</sup> step: Send speed value 1000 min <sup>-1</sup> to the drive (write object 6081h)									
→	601h	23h	81h	60h	00h	E8h	03h	00h	00h	→
←	581h	60h	81h	60h	00h	00h	00h	00h	00h	←
	Confirmation of takeover from drive to master									
	6 <sup>th</sup> step: Send position value 100000 to the drive (write object 607Ah)									
→	601h	2Bh	7Ah	60h	00h	A0h	68h	01h	00h	→
←	581h	60h	7Ah	60h	00h	00h	00h	00h	00h	←
	Confirmation of takeover from drive to master									
	(Repeat step 1 → Statusword should include the value 0627h → axis stopped)									
	7 <sup>th</sup> step: Send <b>new_set_point</b> and <b>relative</b> in the controlword to drive (write object 6040h)									
→	601h	2Bh	40h	60h	00h	5Fh	00h	00h	00h	→
←	581h	60h	40h	60h	00h	00h	00h	00h	00h	←
	Confirmation of takeover from drive to master									
	(Repeat step 1 → Statusword should include the value 9227h; set_point_acknowledge = 1; target reached = 0 → axis moves)									
	8 <sup>th</sup> step: Reset and send <b>new_set_point</b> and <b>relative</b> (write object 6040h)									
→	601h	2Bh	40h	60h	00h	0Fh	00h	00h	00h	→
←	581h	60h	40h	60h	00h	00h	00h	00h	00h	←
	Confirmation of takeover from drive to master									
	9 <sup>th</sup> step: Send speed value 100 min <sup>-1</sup> to the drive (write object 6081h)									
→	601h	23h	81h	60h	00h	64h	00h	00h	00h	→
←	581h	60h	81h	60h	00h	00h	00h	00h	00h	←
	Confirmation of takeover from drive to master									
	10 <sup>th</sup> step: Send position value -100000 to the drive (write object 607Ah)									
→	601h	2Bh	7Ah	60h	00h	60h	79h	FEh	FFh	→
←	581h	60h	7Ah	60h	00h	00h	00h	00h	00h	←
	Confirmation of takeover from drive to master									
	(Repeat step 1 → Statusword should include the value 062Fh → axis stopped)									
	11 <sup>th</sup> step: Send <b>new_set_point</b> and <b>relative</b> in the controlword to drive (write object 6040h)									
→	601h	2Bh	40h	60h	00h	5Fh	00h	00h	00h	→
←	581h	60h	40h	60h	00h	00h	00h	00h	00h	←
	Confirmation of takeover from drive to master									
	(Repeat step 1 → Statusword should include the value 9227h; set_point_acknowledge = 1; target reached = 0 → axis moves)									
	12 <sup>th</sup> step: Reset <b>new_set_point</b> and <b>relative</b> in the controlword and send to the drive (write object 6040h)									
→	601h	2Bh	40h	60h	00h	0Fh	00h	00h	00h	→
←	581h	60h	40h	60h	00h	00h	00h	00h	00h	←
	Confirmation of takeover from drive to master									
	As a loop it can be continued now with step 5.									

## 14.10 Search for reference (homing) via SDO's

Settings: The telegrams described in 6.1 are executed successfully.  
 The drive is to be refer to the next zero pulse with a speed of  $50 \text{ min}^{-1}$  in positive direction (Mode -24, E8h).

Cob-ID	Command	Index		Sub_ID	Data			
		Byte 1 (LSB)	Byte 2 (MSB)		Byte 4 (LSB)	Byte 5	Byte 6	Byte 7 (MSB)
Bit 0...10	Byte 0	Byte 1 (LSB)	Byte 2 (MSB)	Byte 3	Byte 4 (LSB)	Byte 5	Byte 6	Byte 7 (MSB)

Master									Drive	
	5 <sup>th</sup> step: Send operating mode <b>Homing Mode</b> to the drive (write object 6060h)									
→	601h	2Fh	60h	60h	00h	06h	03h	00h	00h	→
←	581h	60h	60h	60h	00h	00h	00h	00h	00h	←
	Confirmation of takeover from drive to master									
	6 <sup>th</sup> step: Check operating mode switchover (read object 6061h)

	Confirmation and return of operating mode from drive to master									

### 14.11 PDO activation and positioning via PDO

Settings: The telegrams described in 6.1 are executed successfully.  
 The drive is to be move on by 100.000 increments from the actual position with a speed of 1000 min<sup>-1</sup> and after attaining the position return by 100.000 increments.

Cob-ID Bit 0...10	Command Byte 0	Index		Sub_ID Byte 3	Data			
		Byte 1 (LSB)	Byte 2 (MSB)		Byte 4 (LSB)	Byte 5	Byte 6	Byte 7 (MSB)

Master									Drive	
	1 <sup>st</sup> step: Send <b>PDO1 rx enable</b> to the drive (write object 1400h, Subindex 1, ID 201h)									
→	601h	23h	00h	14h	01h	01h	02h	00h	00h	→
←	581h	60h	00h	14h	01h	00h	00h	00h	00h	←
	Confirmation of takeover from drive to master									
	2 <sup>nd</sup> step: Send <b>PDO1 tx enable</b> to the drive (write object 1800h, Subindex 1, ID 181h)									
→	601h	23h	00h	18h	01h	81h	01h	00h	00h	→
←	581h	60h	00h	18h	01h	00h	00h	00h	00h	←
	Confirmation and return of operating mode from drive to master									
	3 <sup>rd</sup> step: Send speed value 1000 min <sup>-1</sup> to the drive (write object 6081h)									
→	601h	23h	81h	60h	00h	E8h	03h	00h	00h	→
←	581h	60h	81h	60h	00h	00h	00h	00h	00h	←
	Confirmation of takeover from drive to master									
	4 <sup>th</sup> step: Send position value 100000 to the drive (write object 607Ah)									
→	601h	23h	7Ah	60h	00h	A0h	86h	01h	00h	→
←	581h	60h	7Ah	60h	00h	00h	00h	00h	00h	←
	Confirmation of takeover from drive to master									
	5 <sup>th</sup> step: Switch on NMT operating mode „operational“ for node 1									
→	000h	01h	01h							→
	eventually check the confirmation of takeover from drive to master by Node guarding									
	6 <sup>th</sup> step: <b>Start</b> : Send <b>new_set_point</b> and <b>relative</b> controlword (write object 6040h) with PDO									
→	201h	5Fh	00h							→
←	7 <sup>th</sup> step: Receive <b>PDO tx</b> Statusword (object 6041h) via PDO , <b>setpoint acknowledge</b>								←	
	181h	27h	96h							
←	8 <sup>th</sup> step: Receive <b>PDO tx</b> Statusword (object 6041h) via PDO , <b>target not reached</b>								←	
	181h	27h	92h							
←	9 <sup>th</sup> step: Receive <b>PDO tx</b> Statusword (object 6041h) via PDO , <b>target reached</b>								←	
	181h	27h	96h							
	10 <sup>th</sup> step: <b>Start</b> : Reset <b>new_set_point</b> in the controlword and send (write object 6040h) with PDO									
→	180h	4Fh	00h							→
←	11 <sup>th</sup> step: Receive <b>PDO tx</b> Statusword (object 6041h) via PDO , <b>setpoint acknowledge</b>								←	
	181h	27h	06h							
	12 <sup>th</sup> step: Send position value -100000 to the drive (write object 607Ah)									
→	601h	40h	61h	60h	00h	60h	79h	FEh	FFh	→
←	581h	4Fh	61h	60h	00h	00h	00h	00h	00h	←
	Confirmation of takeover from drive to master									
	13 <sup>th</sup> step: Start as step 6 etc.									

## 14.12 SYNC PDO initialization and positioning in interpolated position mode via PDO

Settings: After initialization, the drive has to control in Interpolated Position Mode with the SYNC telegram to the position setpoint in the PDO1 rx (interpolation cycle 5 ms).  
With the SYNC telegram, status and actual position are to be transmit via PDO1 tx to the master control.

Steps: 1. Initialization of the PDO 1 contents (Mapping of PDO1 tx and PDO1 rx) and activation of the PDO's in the NMT state Pre-operational !

1.1. – 1.6. PDO1 rx mapping and SYNC mode enable

Cob-ID	Command	Index		Sub_ID	Data			
		Byte 1 (LSB)	Byte 2 (MSB)		Byte 4 (LSB)	Byte 5	Byte 6	Byte 7 (MSB)

Master									Drive	
1.1 <sup>st</sup> step: PDO1rx Mapping enable (write object 1600h, Subindex 0, number of entries = 0)										
→	601h	2Fh	00h	16h	00h	00h	00h	00h	→	
←	581h	60h	00h	16h	00h	00h	00h	00h	←	
Confirmation of takeover from drive to master										
1.2 <sup>nd</sup> step: PDO1rx 1.mapped object (write object 1600h, Subindex 1, controlword 6040h )										
→	601h	23h	00h	16h	01h	10h	00h	40h	60h	→
←	581h	4Fh	00h	16h	01h	06h	00h	00h	00h	←
Confirmation and return of operating mode from drive to master										
1.3 <sup>rd</sup> step: PDO1rx 2.mapped object (write object 1600h, Subindex 2, Ip-data-record 60C1h)										
→	601h	23h	00h	16h	02h	20h	01h	C1h	60h	→
←	581h	60h	00h	16h	02h	00h	00h	00h	00h	←
Confirmation of takeover from drive to master										
1.4 <sup>th</sup> step: PDO1rx Mapping entries enable (write object 1600h, Subindex 0, number of entries = 2 )										
→	601h	2Fh	00h	16h	00h	02h	00h	00h	00h	→
←	581h	60h	00h	16h	00h	00h	00h	00h	00h	←
Confirmation of takeover from drive to master										
1.5 <sup>th</sup> step: Activate PDO1 rx SYNC transmission (write object 1400h, Subindex 2, mode 1)										
→	601h	2Fh	00h	14h	02h	01h	00h	00h	00h	→
←	581h	60h	00h	14h	02h	00h	00h	00h	00h	←
Confirmation of takeover from drive to master										
1.6 <sup>th</sup> step: Send PDO1 rx enable to the drive (write object 1400h, Subindex 1, ID 201h)										
→	601h	23h	00h	14h	01h	01h	02h	00h	00h	→
←	581h	60h	00h	14h	01h	00h	00h	00h	00h	←
Confirmation and return of the status word from drive to master, wait for bit 12 homeing attained is high										

**14.13 SYNC PDO initialization and positioning in interpolated position mode via PDO**

1.7 – 1.12 PDO tx mapping und SYNC-Mode enable

Cob-ID Bit 0...10	Command Byte 0	Index		Sub_ID Byte 3	Data			
		Byte 1 (LSB)	Byte 2 (MSB)		Byte 4 (LSB)	Byte 5	Byte 6	Byte 7 (MSB)

Master									Drive
1.7 <sup>th</sup> step: PDO1tx Mapping enable (write object 1A00h, Subindex 0, number of entries = 0)									
→	601h	2Fh	00h	1Ah	00h	00h	00h	00h	→
←	581h	60h	00h	1Ah	00h	00h	00h	00h	←
Confirmation of takeover from drive to master									
1.8 <sup>th</sup> step: PDO1tx 1.mapped object (write object 1A00h, Subindex 1, statusword 6041h)									
→	601h	23h	00h	1Ah	01h	10h	00h	41h 60h	→
←	581h	4Fh	00h	1Ah	01h	06h	00h	00h 00h	←
Confirmation and return of operating mode from drive to master									
1.9 <sup>th</sup> step: PDO1tx 2.mapped object (write object 1A00h, Subindex 2, real-position 6063h)									
→	601h	23h	00h	1Ah	02h	20h	00h	63h 60h	→
←	581h	60h	00h	1Ah	02h	00h	00h	00h 00h	←
Confirmation of takeover from drive to master									
1.10 <sup>th</sup> step: PDO1tx Mapping entries enable (write object 1600h, Subindex 0, number of entries = 2)									
→	601h	2Fh	00h	1Ah	00h	02h	00h	00h 00h	→
←	581h	60h	00h	1Ah	00h	00h	00h	00h 00h	←
Confirmation of takeover from drive to master									
1.11 <sup>th</sup> step: Activate PDO1 tx SYNC transmission (write object 1800h, Subindex 2, mode 1)									
→	601h	2Fh	00h	18h	02h	01h	00h	00h 00h	→
←	581h	60h	00h	18h	02h	00h	00h	00h 00h	←
Confirmation of takeover from drive to master									
1.12 <sup>th</sup> step: Send <b>PDO1 tx enable</b> to the drive (write object 1800h, Subindex 1, ID 181h)									
→	601h	23h	00h	18h	01h	01h	18h	00h 00h	→
←	581h	60h	00h	18h	01h	00h	00h	00h 00h	←
Confirmation of takeover from drive to master									

2. Initialization of the interpolation time (Object 1006h)

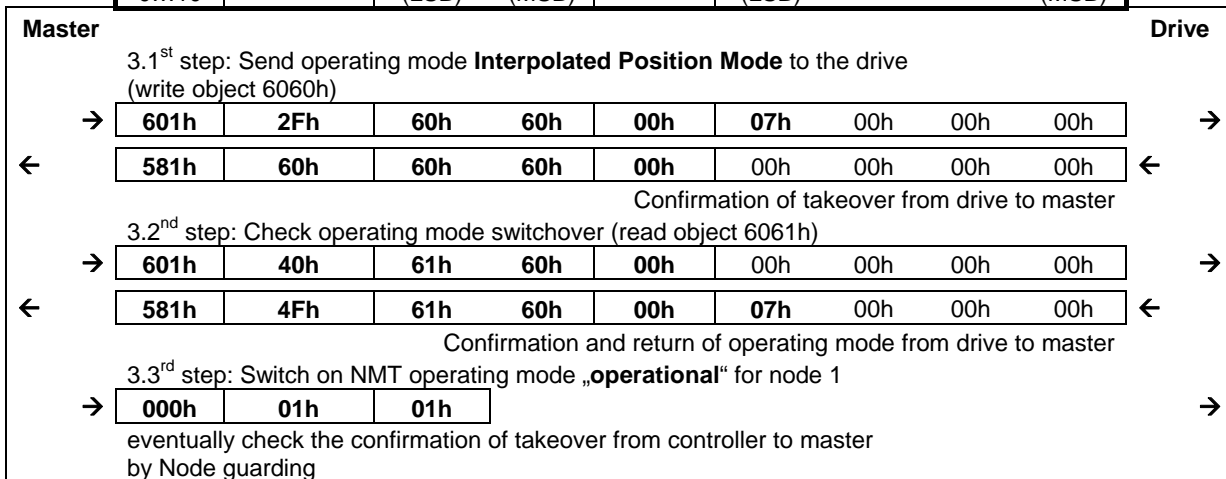

2.1 <sup>st</sup> step: Send <b>PDO1 tx enable</b> to the controller (write object 1006h, 5000 μs = 1388h)									
→	601h	23h	06h	10h	00h	88h	13h	00h 00h	→
←	581h	60h	06h	10h	00h	00h	00h	00h 00h	←
Confirmation of takeover from drive to master									

## 14.14 SYNC PDO initialization and positioning in interpolated position mode via PDO

3. Running-up of the State Machine see Chapter 6.1 step 1 – 4

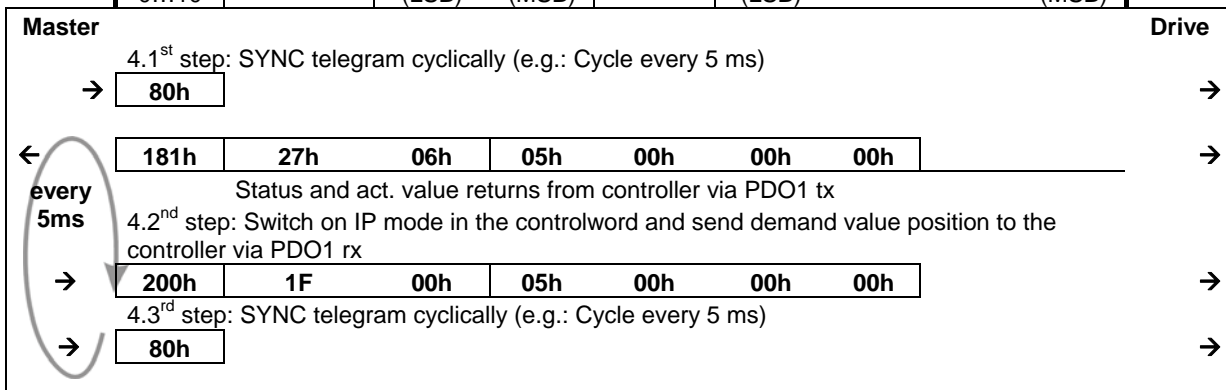

If the State Machine is in „Operation enable“, the operating state Interpolated Position Mode + Operational (NMT, so that PDO's are running) can be switched on.

Cob-ID Bit 0...10	Command Byte 0	Index		Sub_ID Byte 3	Data			
		Byte 1 (LSB)	Byte 2 (MSB)		Byte 4 (LSB)	Byte 5	Byte 6	Byte 7 (MSB)

4. SYNC telegram and activation of the Interpolated Position Mode

Cob-ID Bit 0...10	Command Byte 0	Index		Sub_ID Byte 3	Data			
		Byte 1 (LSB)	Byte 2 (MSB)		Byte 4 (LSB)	Byte 5	Byte 6	Byte 7 (MSB)

**14.15 Profile Velocity Mode**

Settings: The telegrams described in 6.1 are executed successfully.  
 The controller is to be turn with 1000 rpm.

Steps: 1. Initialization of the State Machine as in Chapter 6.1

2.1. – 2.3. Loading operating mode and controlling speed

Cob-ID	Command	Index		Sub_ID	Data			
Bit 0...10	Byte 0	Byte 1 (LSB)	Byte 2 (MSB)	Byte 3	Byte 4 (LSB)	Byte 5	Byte 6	Byte 7 (MSB)

Master									Drive	
2.1 <sup>st</sup> step: Pre-load speed 0 (write object 60FFh, Subindex 0, value = 0)										
→	601h	23h	FFh	60h	00h	00h	00h	00h	00h	→
←	581h	60h	FFh	60h	00h	00h	00h	00h	00h	←
Confirmation of takeover from drive to master										
2.2 <sup>nd</sup> step: Load operating mode 3 (write object 6006h, subindex 0, profile velocity mode=3)										
→	601h	2Fh	06h	60h	00h	03h	00h	00h	00h	→
←	581h	60h	06h	60h	00h	00h	00h	00h	00h	←
Confirmation of takeover from drive to master										
2.3 <sup>rd</sup> step: Pre-load speed 1000 (write object 60FFh, Subindex 0, value = 1000)										
→	601h	23h	FFh	60h	00h	E8h	03h	00h	00h	→
←	581h	60h	FFh	60h	00h	00h	00h	00h	00h	←
Confirmation of takeover from drive to master										

**Note:** Before switchover in another operating mode, the Object 60FFh must be written with 0 !!

A large rectangular area with a black border, containing 25 horizontal lines for writing notes.
